

## **From Creators of USB REZOTONE**

Our qualified team of Russian scientists, PhD and Academicians, who have chosen to give you the opportunity to use our highly protective REZOTONE device against 5G.

Why? The answer to this can be traced back to a journey that started with a pioneer, the re-born Amelia Earhart.

It was her idea to start manufacturing our USB REZOTONE.

The process is that of converting harmful radiation into useful radiation. The radiation itself does not disappear, but is converted into another form. Detailed experiments on reducing the magnitude of the signal from a microwave source in the range of 1-20 GHz, on which the structure we created, were shown, showed that the minimum signal decrease was 14 dB and the maximum was 54 dB.

When electricity of the USB turned off from, the radius of action is reduced to the size of a person's own electromagnetic field, because the structure on the device's antenna works without a radiator. The effect is not limited to EMF, there is a powerful positive effect on all physiological and geobiological parameters, reducing or removing quite a lot of geopathic zones inside and out. Including Curry and Hartman Grids.

The operating time is limited only by the operating time of the electrical components and the physical configuration's state that has been installed on the antenna's generator. If the generator stops working, then the flash drive can be used individually, keeping it within its own field. The prototypes are still working after 10 years.”

We have programs which highly protect from 3, 4, 5G, which rapidly restore and improve all systems in the human body after exposure.

Please share with us your experiences with USB Rezotone to help monitor progress.

We are a small dedicated team of people, with expertise, every USB is handmade, requiring a very sophisticated process, with 5 levels of validation. Even the plastic was carefully chosen, so we can guarantee the best protection against 5G. But our production is small.

Rezotone USB device was created in 2011, has a license issued by the Russian government and a patent. When there was an explosion at Fukushima, the Russian far East was protected from radiation by similar programs on flash USB cards, they were put on cell towers. Because these USB REZOTONE can protect the house, the room and the people inside.

A Russian team of scientists has collected data from 3,000 people who have already used USB REZOTONE over the past years. Some of these people worked in highly toxic radioactive and electromagnetic hazardous areas. But by using a protective USB REZOTONE, it gave them extraordinary positive results with no side effects from radiation.
